Desktop Environment: KDE Plasma

Linux Distribution: Kubuntu

KDE Plasma Website: <https://kde.org/plasma-desktop/>

Kubuntu Website: <https://kubuntu.org/>

After watching the video on Linux desktop environments, I decided to check out **KDE Plasma** because it seemed like it had a lot of customization without being too complicated. I like having options, but I don't want things to feel confusing or slow.

I tried KDE Plasma using DistroSea so I didn't have to install anything. I explored it through **Kubuntu**, which uses KDE Plasma as its default desktop environment. Honestly, it felt pretty familiar right away, especially coming from Windows, so I didn't feel lost trying to use it.

What I liked most was how smooth everything felt. Changing things like the taskbar, themes, and settings was easy, and I didn't notice any lag while doing it. The layout made sense, and I didn't have to dig through menus just to find basic options.

KDE Plasma is a solid desktop environment for someone who wants control over how their system looks and works, but still wants it to run smoothly. I would recommend it to people who want something flexible, familiar, and not too restricted.
